Programme Evidence Hub module-to-capability mapping

Standalone one-page deliverable | Prototype v0.2

All programme details and findings are illustrative. No real company or programme data is included.

Implementation capabilities shown through the demonstrator and proposed single-programme pilot.

Evidence module	Decision need	Implementation capability	Concrete implementation in the pilot	Demonstrated output
Competitive intelligence	Detect external evidence that may change the programme assessment	Scientific and competitive-intelligence curation; semantic retrieval	Curate selected sources, link assets, targets and indications to the programme, and surface material changes with citations.	Traceable external signal and review trigger.
Company strategy	Ensure relevant strategic decisions reach programme teams	Strategy and decision-context structuring	Encode directive, owner, date, affected programmes, rationale and review conditions.	Role-specific strategy context within the programme evidence record.
Governance-as-code	Control who receives which information and when	Metadata-driven governance and role-based information flows	Apply role, domain, classification and explicit-membership rules from a versioned policy file.	Demonstrated policy decisions, gated artefacts and auditability.
Biological rationale and decision history	Preserve why a decision was made	Structured scientific knowledge and decision-rationale capture	Model claims, evidence, alternatives, uncertainty, dissent, approvals and reconsideration triggers.	Versioned decision record linked to source evidence.
Cross-domain evidence and handover	Connect biology, efficacy, safety, CMC and programme context	Multiformat scientific curation, ontology alignment and knowledge modelling	Extract and connect evidence from documents, tables, presentations and structured sources around the programme object.	Decision-ready evidence package and handover view.

Pilot boundary: one programme, one governance gate, a bounded source set, pre-curated evidence and deterministic suggestions. Live client connectors, production authentication and portfolio-scale orchestration remain outside the first engagement.
