Competitive Intelligence Brief

Project AURORA | Version 2.1 | 8 October 2026 | Illustrative Competitive Intelligence

All programme details and findings are illustrative. No real company or programme data is included.

Illustrative target-class landscape

This brief demonstrates how an external signal can be linked to the programme, decision criteria and reconsideration triggers. All competitors and findings are fictional.

Illustrative programme	Stage	Patient-selection approach	Relevant differentiation question
Competitor ALPHA-17	Phase I	Biomarker-enriched	Can A17-03 show a defensible safety or exposure advantage?
Competitor BRAVO-17	Preclinical	Unselected	Does biomarker selection improve response predictability?
Competitor CHARLIE-17	Preclinical	Biomarker-enriched	Can formulation and dosing support a practical route?

Current interpretation

• Two illustrative preclinical competitors and one illustrative Phase I programme are active against the same target class.

• The most advanced programme uses biomarker-enriched enrolment.

• A17-03 differentiation therefore depends on a defensible assay, evidence of activity within the selected population and an explicit normal-tissue risk plan.

Simulated external safety update

Signal date: 8 October 2026 | **Materiality:** High | **Review state:** Awaiting programme review

A fictional Phase I update reports grade 3 keratitis in two of twelve treated patients and a temporary enrolment pause while exposure, construct and mitigation factors are reviewed.

Why this may change the decision

• The signal overlaps with the programme's low-level corneal epithelium binding observation.

• Cross-programme interpretation is uncertain because construct, exposure and patient-selection details differ.

• The signal meets the predefined reconsideration trigger for new clinically relevant normal-tissue toxicity in the target class.

Suggested human action

Re-open the safety-margin criterion, compare construct and exposure differences, and record whether the candidate-nomination rationale or conditions change. No automated programme decision is warranted.
