2027 Antibody Portfolio Direction

Approved illustrative memorandum | 30 September 2026 | Illustrative R&D; Strategy

All programme details and findings are illustrative. No real company or programme data is included.

Approved illustrative direction

Portfolio leadership has set three decision constraints for antibody programmes entering IND-enabling development in the current planning period.

Directive	Decision consequence	Owner
Prioritise biomarker-defined antibody programmes in ovarian and endometrial cancer	A17-03 must define the population and assay claim covered by nomination	Illustrative R&D; Strategy
Require an explicit normal-tissue risk-mitigation path	Residual binding risk must have an owned translational plan and review threshold	Illustrative Safety Governance
Limit the quarter to one new IND-enabling start	Portfolio commitment requires a clear comparison with competing internal opportunities	Illustrative Portfolio Committee

Implications for Project AURORA

• Strategic fit is positive only for a biomarker-defined development case.

• Normal-tissue uncertainty must be presented as a condition with an owner and decision threshold.

• The programme should not infer priority from target biology alone; portfolio capacity and comparative evidence remain part of the governance decision.

Information-flow requirement

The directive should be encoded as programme-linked decision context so that discovery, preclinical and programme-management users receive the relevant constraint without relying on newsletters or manual forwarding.
